

What MAG knows, and what it does not

Generated by `engine/mechanics_coverage.js` . Do not hand-edit — re-run it.

Format `gen9championsvgc2026regmb` . Abilities are restricted to species with non-zero usage and weighted by usage share, so a rare ability on a common Pokémon outranks a common one nobody brings.

Coverage is reported per channel, not by grep. `board.js` names almost nothing — it reads dex fields and probes dex handlers — so searching for an ability name reports nearly everything as missing. That is exactly how Armor Tail and Queenly Majesty came to be listed as absent when both were already modelled at 99%.

Summary

	count	usage share
abilities in this format	192	100%
reached by some channel	92	71.46%
has dex handlers, no channel	98	22.37%
no handlers (nothing to model)	2	0.04%

The holes, ranked by how much of the format they are

An ability with handlers in the dex and no channel in `board.js` is a mechanic the model cannot see at all.

ability	usage share	dex handlers
hospitality	5.42%	onSwitchInPriority, onStart
roughskin	4.51%	onDamagingHitOrder, onDamagingHit
unburden	2.26%	onAfterUseItem, onTakeItem, onEnd
stamina	2.10%	onDamagingHit
unnerve	0.83%	onSwitchInPriority, onStart, onEnd, onFoeTryEatItem
unaware	0.58%	onAnyModifyBoost
liquidvoice	0.55%	onModifyTypePriority, onModifyType
poisontouch	0.49%	onSourceDamagingHit
frisk	0.37%	onStart
stancechange	0.36%	onModifyMovePriority, onModifyMove

widelens	0.80%	nothing

Caveats, so this is not over-read

- A channel means the mechanic is *reachable*, not that it is correct. `feature_coverage.js` answers whether a feature ever fires; this answers whether a mechanic has a route at all.
- `damage` and `named in board` are detected by searching source for the id, so an ability handled generically will show fewer channels than it really has. The bias is toward **under**-reporting coverage, which is the safe direction for a gap list.

- Usage share is of the whole format, so shares do not sum to 100% across a filtered table.
