

Handoff — 2026-07-24

Read this first if you are picking up ABRA in a new session.

o. THERE IS DAMAGE TO REPAIR. DO THIS BEFORE ANYTHING ELSE.

A run of the OLD `push-all.bat` (the version using `git merge -X ours`) broke two things:

Problem	State
<code>data/games.ladder.jsonl</code>	16,139 lines, 8,139 duplicates. Should be 7,547 unique.
ABRA git	Detached HEAD. Not on <code>main</code> .

Nothing is lost. Every game is still present, just duplicated. Repair:

```
cd C:\Users\willj\Projects\Pokemon\ABRA
git status                        # look before touching anything
git checkout main                 # get off detached HEAD
python engine\dedupe_store.py --write # 16,139 -> 7,547
python engine\sanity_check.py      # must report 96 passed, 0 failed
git add -A && git commit -m "repair: dedupe store after a merge -X ours reconciliation"
git push origin main
```

Cause, so it does not happen a third time. `data/games.ladder.jsonl` is an APPEND-ONLY log. `git merge -X ours` on divergent histories replays the appended block, so every game lands twice. This is now the third occurrence (7,040 lines, then 401, then 8,139). `push-all.bat` must use `git rebase`, never `merge -X ours`. A rewrite doing exactly that was written and then lost when the file reverted on disk; **it needs to be redone.**

1. Why pushing kept failing

Cowork runs the shell in an isolated Linux VM with no access to the machine's git credentials and no route to the account's connectors. `git push` from that shell **cannot** authenticate, regardless of what is authorised on the account. The GitHub connector being enabled does not help, and repeatedly asking the user to re-authorise it was wrong.

Use Claude Code in a terminal for anything involving git. There the shell runs on the user's own machine with their credentials and `git push` simply works.

The user's rule number one: do not ask them to run commands, and never take over their machine. Machine control was tried once and caused the damage in section o. Do not repeat it.

2. What was actually achieved today (all committed locally)

The rollout engine was wrong in eight ways, all silent

`engine/medicham2-browser.js` — fixed: random status instead of the move's status; only Fake Out could flinch; no type or ability immunities; priority a hand-typed table of 18 moves (all 14 negative-priority moves resolved at 0, so Trick Room went at normal speed); flinch leaked into the next turn; **Intimidate applied unconditionally with the sign reversed on Defiant/Competitive**; no powder immunity; Prankster hit Dark types.

Measured effect: **4.35** points of P(win) on average across 120 real matchups, max 24.2, favourite flipped in 9.2%. Tests: `tests/test-rollout-effects.js`, 39 assertions.

The official Champions engine exists and we should switch to it

`data/mods/champions/` is in the Showdown **master** branch (not the npm package). Format `gen9championsvgc2026regmb` is exactly ours. `engine/champions_sim.js` runs it, pinned to commit `20ad99ffc9a5a4a4e8fb56ab04ad8e4255b3f2b4`. `engine/prior_player.js` ports our policy into it.

With identical teams and identical policy, our engine and the official one disagree by 31.1 points. Everything fixed today was worth 4.35. See `docs/ADR-001-use-the-champions-mod.md`, which records all four comparison attempts including the three that were wrong.

Speed: official 29 battles/sec/core, ours 3,401. Offline batch work is fine; live browser use is not, and is not needed — precompute tables offline and ship them.

Five bot accounts were hiding in the data

Name-based detection missed them. The decisive signal is **team invariance**: `Carchdraw84172` played 459 games with exactly one team, 367 of them in a single day. Four of the five ran the SAME six Pokemon in 1,446 games.

Clean games: **927 of 7,547 (12.3%)**, not the 1,941 previously believed. Definition lives in `data/quality-filter.json`; readers are `engine/quality.js` and `engine/quality.py`, cross-checked by `tests/test-quality.js`.

The metagame model was literally the bot's team

`meta-usage.json` — the file CHOMP reads — had this top six:

`garchomp`, `whimsicott`, `basculegion`, `kingambit`, `charizard`, `sylveon`

That is, in full, the bot team's six Pokemon. Corrected top six after filtering: `garchomp`, `incineroar`, `kingambit`, `sinistcha`, `whimsicott`, `basculegion`. Basculegion 34.1% -> 17.9%. `engine/analyze.js` now uses the quality filter and stamps provenance into its output.

Smaller fixes

- Nature table held 23 of 25. **Naughty** and **Lax** fell through to neutral.
 - The store's duplicate check read only the first 5,000 lines while all duplicates sat past 7,144.
 - Champions status constants verified against the mod's `conditions.ts`: para `randomChance(1,8)`, sleep `sample([2,3,3])`, freeze `randomChance(1,4) + startTime = 3`. All three correct.
 - Stat formula confirmed from `scripts.ts`: `base + SP + 20`, HP `base + SP + 75`.
-

3. Open work, in priority order

1. **Repair section 0.** Nothing else matters until the store is deduped and ABRA is on `main`.
2. **Rewrite** `push-all.bat` to use `git rebase`, dedupe before committing, and STOP on conflict rather than resolving with `-X ours`.
3. **36 engines still read the store raw**, bypassing the quality filter — GURU, WAR, roles, XATU, archetypes, playstyle, cores and the rest. Only `analyze.js` and `chomp_ev.js` are wired. A patch converting the five `def load_games()` engines was written and NOT applied.
4. **The site claims 5,199 and 7,716 games.** Both wrong. Defensible figure is 927, with the funnel shown. `data/live.js` and `web/index.html`.
5. **Continue ADR-001:** port the policy properly, run the damage golden master against the simulator, then build the offline precompute job.

4. Nothing has been pushed

Every commit from today is local only. ABRA was ~45 commits ahead of `origin/main` before the detached-HEAD incident; verify with `git log --oneline origin/main..HEAD` after checking out `main`.
